

Assignment – Refactoring Legacy Code

In the folder, you will find HTML and JS files that display an order calendar. Your task is to refactor the HTML and JS into components. Do not use input fields for storing the state. Split the component into two sections: a navigation bar and a time list. The calendar should be fully functional, including navigation forward and backward. Generate the API for days randomly according to the attached schedule.

Penalties: Unclear code, non-functional project, inclusion of `node_modules` in the archive.

Bonus Points: Use of SolidJS, JSDoc, well-structured code, ESLint, Prettier, Storybook.

Data flows into the form in the following sample format:

```
{
  "Status": "OK",
  "Message": "OK",
  "Data": [
    {
      "Time": "00:00",
